

# Powerful label printing

*Expertise in labels – make the most of variety and technology*

*By Pia Grund-Ludwig*

The software developers from Ferdinand Eisele have staggered the features of the new main version of eXtra4<winIII> – the tried and tested program for label printing in the world of jewellery and watches – across eight editions.

Beginners best start with UltraLite – the download is free and without any user time limit. Users can select a label design, input data, and print a single label per print job. On registration, users receive a free upgrade to Lite, and a 60-day trial for many additional features. Basic, the third edition, covers a jeweller's average needs in label printing. From Advanced upwards, the program offers ever-more features for professional IT

environments: connectivity to external databases and POS systems as well as cooperation with client-server databases as in most stock management systems. The Enterprise edition is aimed at companies with branch operations. The most powerful edition, Enterprise RFID, currently under development, will make additional RFID technology available.
